

3Steps Athletics Website Guide

blabla

Making edits

Here's a quick guide to the website's folder structure so you know where to find things. The site is built with **Next.js** (using the App Router) and **Tailwind CSS**, with translations managed in JSON files.

Don't worry, it's fairly organized! Here's the breakdown of where to go for common edits.

Quick Guide: "Where do I edit...?"

Here's a fast lookup table for the most common tasks:

If you want to...	Go to this file/folder...
Change text (like buttons, titles, paragraphs)	<code>messages/en.json</code> (for English) or <code>de.json</code> (for German)
Add or edit a news article	<code>src/data/newsItems.js</code>
Edit the main menu (navigation bar)	<code>src/components/Navbar.js</code>
Edit the footer	<code>src/components/Footer.js</code>
Edit the content/layout of a specific page (like "Who We Are")	<code>src/pageComponents/WhoWeAre.js</code> (see section below)
Add a new page to the site	<code>src/app/[locale]/</code> (e.g., create a new folder <code>src/app/[locale]/new-page/page.js</code>)
Add a new logo or image (used in a component)	<code>src/assets/</code> (and then <code>import</code> it in your file)
Add a new PDF (like the legal notice)	<code>public/</code> (you can link to it directly, like <code>/new-file.pdf</code>)
Change the site's main colors or fonts	<code>tailwind.config.js</code>
Add global CSS styles	<code>src/app/globals.css</code>

Key Folders & Files Explained

Here's a bit more detail on the most important folders you'll be working in.

1. `messages/`

This is where **all the website's text lives**. Instead of hard-coding text like "About Us" into the components, we use keys.

- `messages/en.json`: All English text.
- `messages/de.json`: All German text.

Example: To change the main heading on the contact page, you'd open `en.json`, find a key like `"contact.title": "Get in Touch"`, and just change the text "Get in Touch".

2. `src/app/`

This folder controls the **pages and routes** of the website. The structure here *matches the URL*.

- `src/app/[locale]/page.js`: This is the **homepage**.
- `src/app/[locale]/about/page.js`: This is the **"About" page** (www.3stepshockey.ch/en/about).
- `src/app/[locale]/contact/page.js`: This is the **"Contact" page**.
- `layout.js`: These files are "wrappers" for pages. The one at `src/app/[locale]/layout.js` is the main one that includes the **Navbar** and **Footer** on *every page*.

3. `src/pageComponents/`

This is probably where you'll spend **most of your time**.

The `page.js` files in the `src/app` folder are usually simple. They just *import* the *actual content* from this `src/pageComponents` folder.

Example Workflow:

1. You want to edit the **"Who We Are"** section on the "About" page.
2. You'd open `src/app/[locale]/about/page.js` and see that it imports a component like `<WhoWeAre />`.
3. You'd then go to `src/pageComponents/WhoWeAre.js` to make your edits to the layout, text (keys), and images.

4. `src/components/`

This folder is for **small, reusable components** that are used *all over* the site.

- `Navbar.js`: The main navigation menu.
- `Footer.js`: The site footer.
- `SportCard.js`: A single card used to display a sport.
- `TeamMemberCard.js`: A card for a single team member.

Edit these files if you need to change the *structure* of these repeating items.

5. `src/assets/` & `public/`

These are for your images and files.

- `src/assets/`: For images you `import` into your components (like logos, icons).
- `public/`: For static files that are linked directly (like `legal_notice.pdf` or `favicon.ico`).

6. `src/data/`

This is for any data that's more complex than simple text strings, like a list of news articles.

- `newsItems.js`: Go here to add, edit, or remove news articles.

Files You Can (Probably) Ignore

You shouldn't need to touch these files. They are for project configuration.

- `.mjs` files (`next.config.mjs`, `eslint.config.mjs`)
- `.json` files (`package.json`, `jsconfig.json`)
- `postcss.config.js`
- `tailwind.config.js` (unless you're changing the brand colors/fonts)

Hope this helps! Let me know if you have any questions.
